

Key differences between skill v1, v2, v2.1

v1 SKILL.md

46 lines

Unique factor:

minimalist — just "locate, read both sides, decide, output." No taxonomy of conflict types.

Why built: establish a baseline prompt for the LLM to resolve a single conflict block and return only the resolved file.

Key excerpt:

Determine the correct resolution. Choose one of: Keep branch A's changes / Keep branch B's / Combine both / Write a new resolution. [...] Return only the resolved file wrapped in a single code block ... Do not include explanations.

v2 SKILL.md

131 lines

Unique factor:

introduces a 4-pattern taxonomy (**empty / combine / pick / custom**), ordered decision tests, a priority ladder for *pick* (symbol references)

Why built:

Decision-procedure framing — turns the open-ended choice into a strict ordered test so the model defaults to *pick* and only escapes to *custom* when justified.

Key excerpt:

*There are four patterns: **empty**, **combine**, **pick**, **custom**. Apply the following tests in order — the first match decides. ... Do not jump to custom. Most conflicts are pick.*

V2.1 SKILL.md

173 lines

Unique factor:

adds an upfront **Output discipline** section (no comments, no surrounding-code echo, no fabricated identifiers); splits the empty test into 1a/1b so a single empty side becomes *pick*; allows *custom* to use surrounding-code tokens as a secondary source;

Why built: targets the specific failure modes (echoing surrounding code, fabricating identifiers, adding comments) that v2 still allowed

Key excerpt:

No comments in the code block ... No surrounding-code echo.** Do not copy lines from the surrounding code into the resolution ... **No fabricated identifiers.
