

Key differences between skill v1, v2, v2.1

what the version specifies

why it was built that way

quoted verbatim from the file

Unique factor

v1 SKILL.md 277 words

minimalist: locate the conflict, read both sides, decide, output. Four options as a flat list, and no pattern hierarchy.

Why built

establish a baseline prompt: resolve one conflict block and return only the resolved file, so later versions have a control to improve on.

Key excerpt

Determine the correct resolution. Choose one of: Keep branch A's changes / Keep branch B's / Combine both / Write a new resolution.

v2 SKILL.md 742 words

a four-pattern hierarchy — empty, combine, pick, custom — applied as ordered tests, plus a priority ladder for pick on symbol references.

decision-procedure framing — turn the open-ended choice into a strict ordered test, so the model defaults to pick and only escapes to custom when justified.

There are four patterns: empty, combine, pick, custom. Apply the following tests in order — the first match decides. ... Do not jump to custom. Most conflicts are pick.

v2.1 SKILL.md 1102 words

an upfront output-discipline section: no comments, no surrounding-code echo, no fabricated identifiers. The empty test splits so one empty side becomes pick; custom may use surrounding-code tokens.

target the failure modes v2 still allowed: echoing the surrounding code, fabricating identifiers, and adding comments.

No comments in the code block ... No surrounding-code echo. Do not copy lines from the surrounding code into the resolution ... No fabricated identifiers.
